

Jeff Forssell

The exciting possibilities to develop technique, economy and society so that our future shall be fun and truly sustainable are what I want to work with.

In recent years, my formal qualification as physics and mathematics teachers has been complemented with the development of distance learning for adults, in particular, through IT. I am very proud that the students appreciated the simulations and interactive exercises with built-in help, which I built in Mathematics and Physics.

My background as an experimental physicist has also influenced the years of experience in alternative energy, with wind generator, bio-fuels, solar energy and energy storage. Many years' experience with agriculture, helping drug addicts, and foreign-aid jobs have widened my perspective.

I have a great deal of experience, and belief in further development, of using IT to disseminate knowledge and build cooperation. Spreadsheet use and visualization are also things I like to do. Getting "dirt under my fingernails" so that something gets done is more interesting than waiting for someone else.

Building up direct contact with end users, I find stimulating. User feedback guides my process priorities, and evaluation, confirms high quality.

The solid foundation of IT skills I've built up through my own interest made it possible for me to work in a major project in a new role, as Flash programmer, and perform with high quality and meet time goals, in spite of making improvements in the plan and still finding many occasions to continue to

develop my skills, especially about the virtual learning environment Moodle, which I love.

Students, customers and colleagues have characterized me as:

- ambitious with high, clear goals and values,
- longing to understand the viewpoints of others, self-sustaining, creative, investigating, a knowledge builder and sharer
- a great "all-round" problem solver with a broad theoretical and practical base and perseverance in my toolbox.

Those who get to know me, find I care very much about others' welfare and have a sense of humor.

My ambition is to be part of the solution to the problems we are seeing in the areas of health, life, "empowering" knowledge and sustainability.
